(in Japanese) ゲノム安定化維持の機構

- Lecture summary (講演概要): Please summary your lecture 200-500 words.

The genome of a cell is continuously challenged by DNA damage from both internal and external sources. Internal sources of DNA damage occur as the byproducts of normal cellular metabolism or DNA replication, while external sources of DNA damage include ultraviolet radiation from the sun and toxic environmental chemicals. Failure to correct DNA damage can cause cell death and lead to cancer and other diseases. The good news is that organisms have evolutionarily developed a genome protection mechanism, called "checkpoint", which detects the problems and co-ordinate a global response to protect genome integrity. In my lecture, I discussed about (1) the cell cycle machinery and checkpoint control of the cell cycle, (2) defective DNA damage responses and checkpoint-related syndromes, (3) cancer treatment based on knowledge about the DNA damage responses. I also gave a presentation about my home country Malaysia, the reason why I became a researcher, and daily life as a researcher.
