- Lecture summary (講演概要): Please summary your lecture 200-500 words.

Interdisciplinary (学際的) research is a current trend for breakthrough and deep understanding in various research fields. Especially, biophysics is one of important research field to understand physical and chemical reactions in a cell. Among various research topics, photosynthesis is a representative research topic which require interdisciplinary research and is also important to solve energy and food crisis for our future. My research is related with biophysical study on photosynthesis, especially light-harvesting systems and its regulation. Photoprotection mechanism is the one of crucial regulation mechanisms in photosynthetic organisms against strong light conditions beyond their photosynthetic capacity. State transition is the mechanism which is responsible for excitation energy balancing between two photosystems. The two photosystems, photosystem I and II, are distributed in stroma lamella and grana membranes respectively. My research is on the relationship between state transitions and the structural/distributional heterogeneity of photosystems. My research revealed that heterogeneous structure of thylakoid membranes is closely related with and likely modulates state transitions of photosystems.
